

Simon's Favourite Photographers

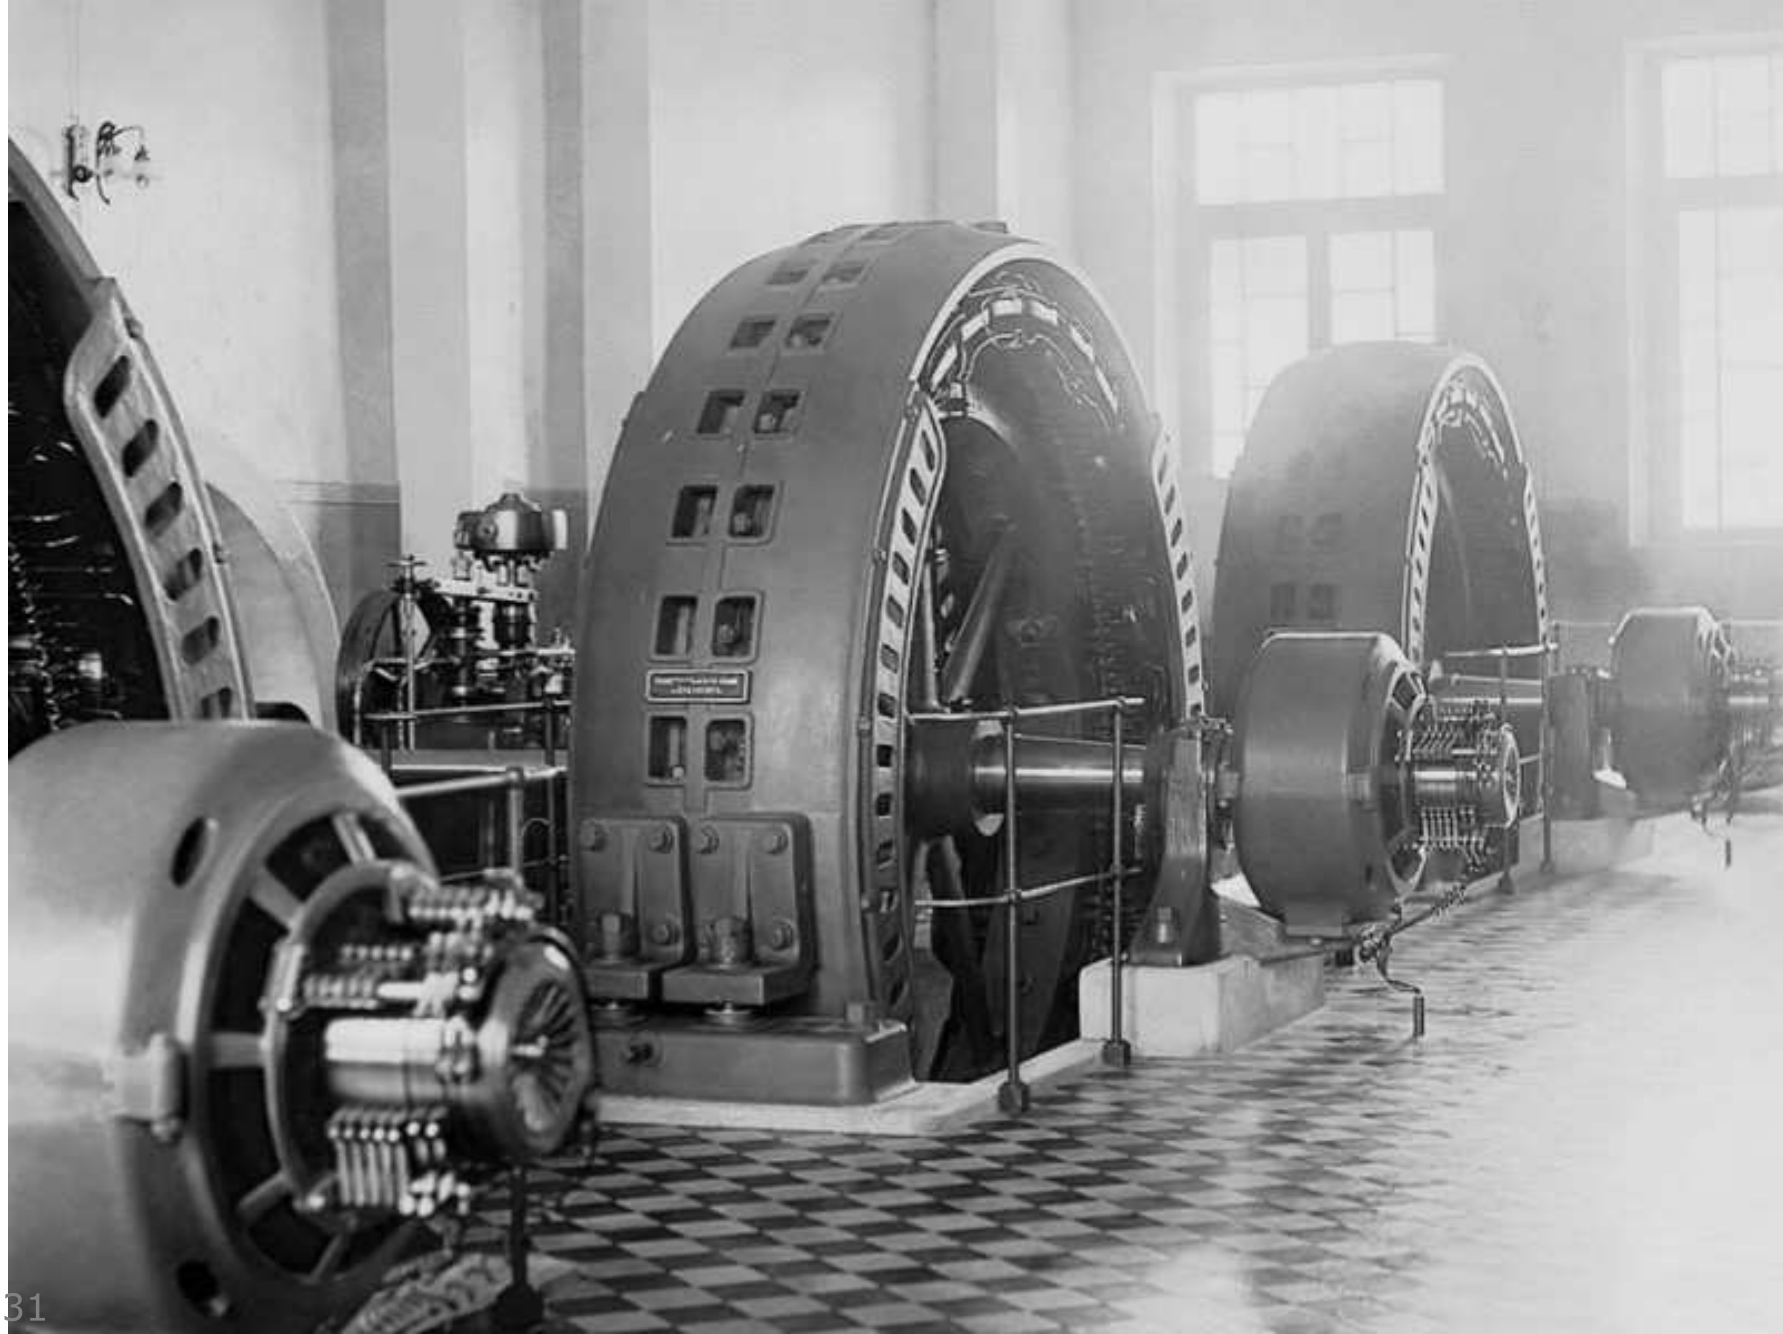

Part 1

Sergey Prokudin-Gorsky 1863-1944

Prokudin-Gorsky's Camera

Red

Green

Blue

Great, 3 black and white photos - whoop !

The BEST thing is...

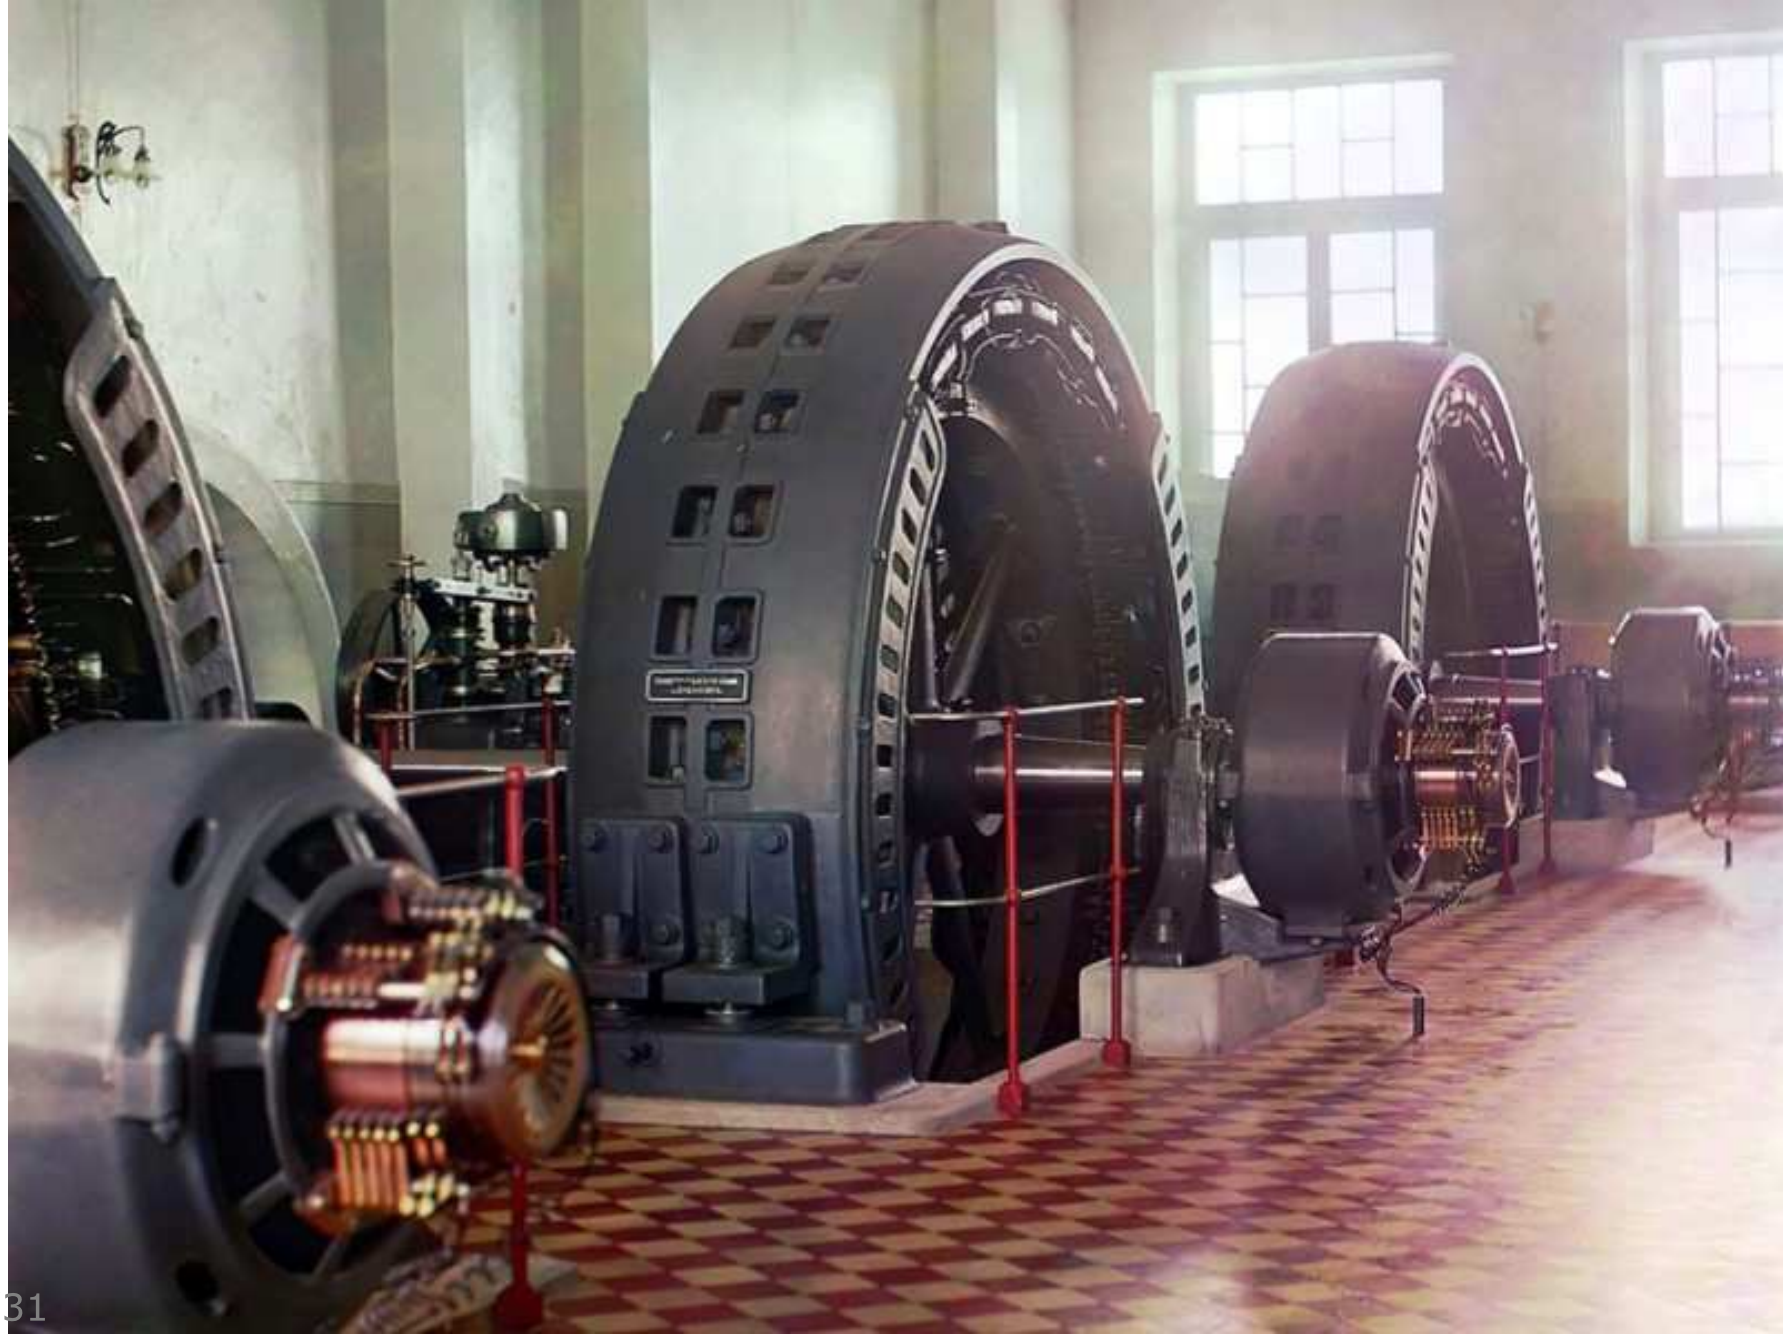

These images are NOT "colorised" or AI enhanced

We have the original triple-exposure negative sets
Which contain ALL the RGB channel data - intact !

We can now recompose the original colour images
Data is very rich - perfect for digital manipulation

Want to see more ?

Check out the US library of congress:

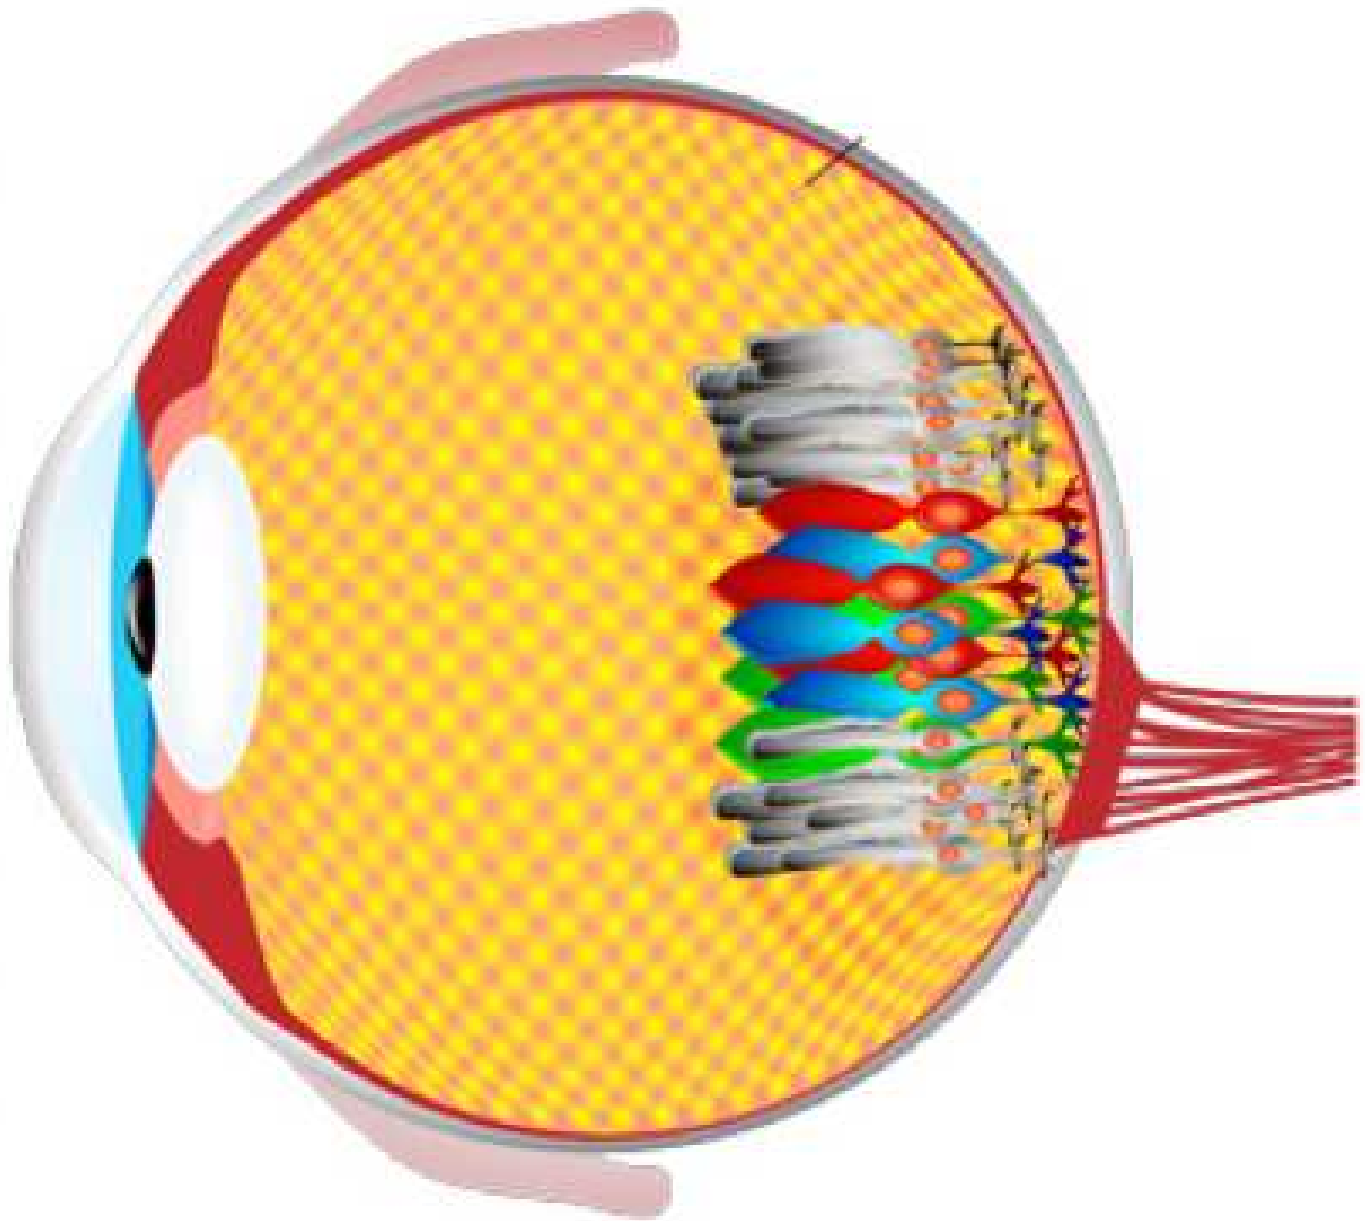

<http://www.loc.gov/exhibits/empire/>

Why am I telling you this ?

This concept of representing colour using three separate RGB channels still VERY relevant today

Basis of the majority of modern cameras, displays, projectors, file storage, image editing tools etc.

It's an *approximation* to real world colour
But it's good enough to convince the human eye...

Not everyone is the same !

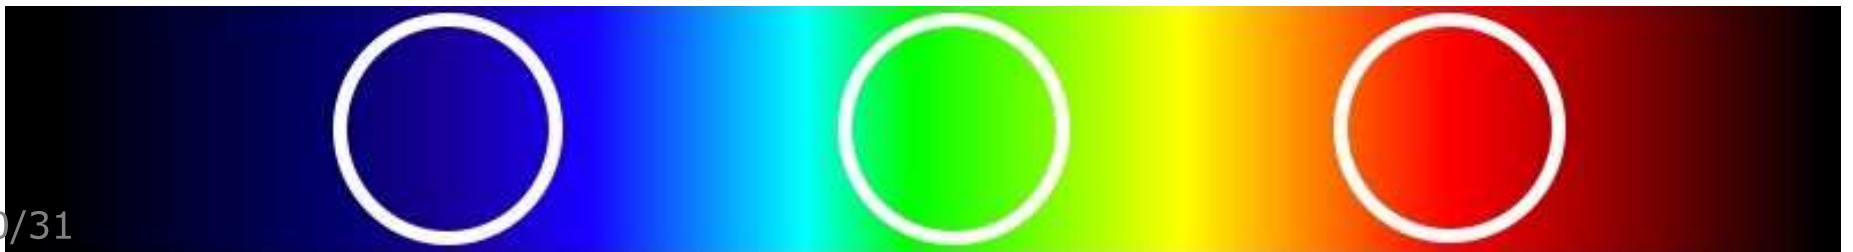

Be careful: notion of 3 receptors is a generalisation

Not everyone is identical

Some have less sensitive receptors or even...

Completely non-functioning cones:

- Red-green colour blindness
- Blue-yellow colour blindness
- Total colour blindness !

Tetrachromacy

A small number of people are "tetrachromats"

They have 4 types of colour sensing receptors !

Extra receptor has a pickup between green & red

This results in "increased chromatic discrimination"

(They can see a richer variety of colours !!!)

You might be one, but just don't know it :o)
